

PROJECT REPORT

Student Grade Calculator

A Basic Python Project

Name	Aman Aryan
Registration Number	26BAI11022
Project Type	Basic Python Project
Language	Python

1. Introduction

I made this project using Python to calculate a student's result. The program takes marks as input and then shows the total marks, percentage and grade. I chose this topic because it is simple and helped me understand the basic use of Python.

2. Aim of the Project

The main aim of this project is to make the calculation of a student's result easier. Instead of calculating the total and percentage manually, the program does it after the marks are entered.

3. Why I Made This Project

This is a beginner-level project. I wanted to use the basic Python concepts that I have learned and make something that gives a proper output. The project also helped me understand how conditions can be used to decide a student's grade.

4. Tools Used

I used Python to write the program. The code can be written and run using a simple editor such as VS Code or Python IDLE. No extra Python library is required for this project.

5. Basic Concepts Used

- Variables
- input() and print()
- Arithmetic operations
- if-else conditions

6. How the Program Works

1. The program asks the user to enter marks for each subject.
2. It adds all the marks to get the total.
3. The percentage is calculated using the total marks.
4. The percentage is checked using if-else conditions.
5. Finally, the program displays the percentage and grade.

7. Grade System Used

Percentage	Grade
90 - 100	A+
80 - 89	A
70 - 79	B
60 - 69	C

50 - 59	D
Below 50	F

8. Sample Run

Marks entered:

English: 80

Maths: 75

Physics: 90

Computer: 70

Chemistry: 85

Result:

Total Marks: 400

Percentage: 80.0%

Grade: A

9. Advantages

- Easy to use and understand.
- Saves time in doing basic calculations.
- Good for practicing basic Python.

10. Limitations

The current program is only a basic calculator. It does not save the result or keep records of different students. The user has to enter the marks each time the program is run.

11. What I Learned

While making this project, I understood how to take input from the user, perform calculations and use if-else conditions. I also got more practice with writing and running a Python program.

12. Conclusion

The Student Grade Calculator is a simple Python project that calculates the total marks, percentage and grade of a student. It is a small project, but it helped me practice the basic concepts of Python and understand how they can be used together in a program.
